1 MIVKKLYFVPAGRCMLDHSS.....VFFGHDIBQERGCKVFPEYI 250 Title: Perfect score: Sequence:

127863 seqs, 47026705 residues Searched:

BLOSUM62 Gapop 10.0 , Gapext 0.5

Scoring table:

127863 Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0%
Maximum Match 100%
Listing first 45 summaries

SwissProt_41:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Warner J.B., Strong and induction of the Mg(2+)-citrate transporter CitM of Bacillus subthis."
J. Bacteriol. 182:6099-6105 (2000).
-!-INDUCTION: Expression is under strict control of the medium composition. Induced by citrate, probably via the two-component regulatory system citT/citS. Repressed by rapidly metabolized carbon sources like glucose, glycencol and inositol, via the carbon catabolite repression system. Is also repressed by succinate and glutamate, albeit to a lesser extent.

Strain Arabidopais full length cDNA clones (RAFLs) sequenced by the Shinozaki W. Salk/Stanford/PoBSC)."
Submitted (MAR.2002) to the EMBL/GenBank/DDBJ databases.
LACTOYL-GLUTATHIONE TO FORM GUITATHIONE AND D-LACTIC ACID.
C.-I- CATALYTIC ACTIVITY: (S)- (2-hydroxyacyl)glutathione + H(2)O = glutathione + a 2-hydroxy acid anion.
C.-I- CATALYTIC ACTIVITY: (S)- (2-hydroxyacyl)glutathione + H(2)O = clopacy acid anion.
C.-I- PATHWAY: Glyoxal pathway.
C.-I- PATHWAY: Glyoxal pathway.
C.-I- SIMILARITY: BELONGS TO THE GLYOXALASE II FAMILY.

PIR 76:* Database

1: pirl:* 2: pir2:* 3: pir3:* 4: pir4:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Appothetical protein Rv2300c - Mycobacterium tuberculosis (strain H37RV)
C,Species: Mycobacterium tuberculosis
C,Bate: 17-Jul-1998 #sequence_revision 17-Jul-1998 #text_change 22-Oct-1999
C,Accession: H70733
R,Cole, S.T.; Brosch, R.; Parkhill, J.; Garnier, T.; Churcher, C.; Harris, D.; Gordon, S, Connor, R.; Davies, R.; Parkhill, T.; Geneles, S.; Hamlin, N.; Holroyd, S Rajandream, M.A.; Rogers, J.; Rutter, S.; Seeger, K.; Skelton, S.; Squares, S. Nature 393, 537-544, 1998
A,Authoris: Sqares, R.; Sulston, J.E.; Taylor, K.; Whitehead, S.; Barrell, B.G. A; Title: Deciphering the biology of Mycobacterium tuberculosis from the complete genome A,Reference number: A70500; MUID:98295987; PMID:9634230
A,Accession: H70733
A,Accession: H70733
A,Residues: preliminary; nucleic acid sequence not shown; translation not shown
A,Molecule type: DNA
A,Residues: 1-2100 CCCL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A;Cross-references: GB:Z77163; GB:AL123456; NID:g3261610; PIDN:CAB00971.1; PID:e255162; A;Experimental source: strain H37Rv C;Genetics: A,Genetics: A,Gene. Patent No. 6562958
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
TITLE REFERENCE GTC99-0394
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
NUMBER OF SEQ ID NOS: 8252
LENGTH: 311
                                                                                                                                                                                                                                                                                                                                                                                                                            14;

Patent No. 6380370
GENERAL INFORMATION:
APPLICANT: Lynn Doucette-Stamm et al
TITLE OF INVENTION: BPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS
FILE OF INVENTION: DOUCETTE ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS
FILE REPERRNCE: GTC-007
CURRENT APPLICATION NUMBER: US/09/134,001C
CURRENT FILING DATE: 1998-08-13
PRIOR APPLICATION NUMBER: US 60/064,964
PRIOR FILING DATE: 1997-11-08

Patent No. 5783431
GENERAL INFORMATION:
APPLICANT: Peterson, et al.
TITLE OF INVENTION: BCREENING NOVEL METABOLIC PATHWAYS
NUMBER OF SEQUENCES: 51
COMMERSPONDENCE ADDRESS:
ADDRESSEE: Pennie & Edmonds
STREET: 1155 Avenue of the Americas
                                                                                                                                                     CORPLOYER: Floppy disk
COMPUTER: IBM PC compatible
COMPUTER: IBM PC compatible
CORRATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: PCT/US94/10151A
FILING DATE: 13-SEP-1994
CLASSIFICATION NUMBER: PCT/US94/10151A
ATTORNEY/AGENT INFORMATION:
NAME: Osman, Richard A.
REFSERNCE/DOCKET NUMBER: 36,627
REFSERNCE/DOCKET NUMBER: PF-58750-PC/RAO
TELECOMMUNICATION INFORMATION:
TELEPHONE: (415) 398-3249
TELERA: 910 277299 FHT UR
INFORMATION FOR SEQ ID DO: 62:
SEQUENCE CHARACTERISTICS:
LENGTH: 724 amino acids
TTYPE: amino acid
TTYPE: amino acid

```
The present sequence is a bacterial autoinducer inactivation protein (AilA). It is useful for increasing disease resistance as well as preventing or reducing bacterial damage to a plant or animal. The nucleic acid encoding the AilA protein may be used to confer resistance to diseases where expression of pathogenic genes are regulated by autoinducers, such as diseases caused by pseudomonas aeruginosa, Erwinia stewatii, Xenorhabdus nematophilus, Erwinia chrystauthemi, Pseudomonas solanacearum and Xanthomonas campestris. It may also be used to confer soft rot disease resistance in susceptible plants such as potato, eggplant, Chinese cabbage, carrot and celery. The bacterial autoinducer infections in animals including humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      121 IIVQRAEYEAAQHSEEYLKECILPNINYKIIEGDYEVVPGVQLLHTPGHTPGHQSLLIET 180

autoinducer (N -ageline autoine) inactivation protein. The autoinducer (N -agyl-homoserine latcine) inactivation protein. The complaints of autoinducer is useful for increasing disease resistance in a plant or animal by introducing a polymuclectide into a cell of such a plant or animal by introducing a polymuclectide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein of suseful for reducing bacterial damage to a plant or animal preferably human; and for reducing the formation of bacterial bicilins, by exposing consistent of the autoinducer inactivation protein. A characterial cell transformed with the polymuclectide, especially a plant or animal bacterium preferably Bacillus thuringiansis which is from Bl. B2, conting a susceptible plant or animal, where virulence is regulated by autoinducers e.g. potato soft rot disease caused by Erwinia carotovora. This is the amino acid sequence of the Bacillus sp. 240Bl autoinducer inactivation protein. Aim, a putative metallohydrolase and autoinducer inactivation protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

autoinducer (N-acyl-homoserine lactone) inactivation protein. The autoinducer (N-acyl-homoserine lactone) inactivation protein. The polynucleotide is useful for increasing disease resistance in a plant or animal by introducing a polynucleotide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein is useful for reducing bacterial damage to a plant or animal preferably comman; and for reducing the formation of bacterial biofilms, by exposing biofilm-forming bacteria to the autoinducer inactivation protein. A capacterial cell transformed with the polynucleotide, especially a plant or animal bacterium preferably Bacillus thuringiensis which is from B1, B2, animal bacterium preferably Bacillus thuringiensis which is from B1, B2, disease in a susceptible plant or animal, where virulence is regulated by autoinducers e.g. potato soft rot disease caused by Erwinia carotovora. This is the amino acid sequence the autoinducer inactivation protein converse.
                                                                                                                                                                                     Polynucleotide encoding autoinducer inactivation protein, bacterium having polynucleotide, and protein useful for increasing resistance a disease in sustainable plant or animal and for reducing bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Autoinducer inactivation; AiiF; N-acyl-homoserine lactone;
                                                                                                                                                                                                                                                                                                         The invention describes an isolated polynucleotide

The invention describes an isolated polymucleotide encoding an autoinducer (N-acyl-homoserine lactone) inactivation protein. The autoinducer (N-acyl-homoserine lactone) inactivation protein. The polymucleotide is useful for increasing disease resistance in a plant or animal by introducing a polymucleotide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein is useful for reducing bacterial damage to a plant or animal preferably human; and for reducing the formation of bacterial biofilms, by exposing biofilm-forming bacteria to the autoinducer inactivation protein. A caries animal bacterium preferably Bacillus thuringiensis which is from B1, B2, B1, B1, B2, B2, B2, B2, B2, is useful for increasing resistance to a disease in a susceptible plant or animal, where virulence is regulated by autoinducers e.g. potato soft rot disease caused by Erwinia carotovora.

This is the amino acid sequence of the autoinducer inactivation protein activity of which is studied in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180

The invention describes an isolated polynucleotide encoding an autoinducer (N-acyl-homoserine lactone) inactivation protein. The polynucleotide is useful for increasing disease resistance in a plant or animal by introducing a polynucleotide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein is useful for reducing bacterial damage to a plant or animal preferably human; and for reducing the formation of bacterial biofilms, by exposing biofilm-forming bacteria to the autoinducer inactivation protein. A bacterial cell transformed with the polynucleotide, especially a plant or animal bacterium preferably Bacillus thuringiensis which is from B1, B2, B17, B18, B20, B21, B2 and B25, is useful for increasing resistance to disease in a susceptible plant or animal, where virulence is regulated by autoinducers e.g. poctato soft rot disease caused by Brwinia carotovora. This is the amino acid sequence of the autoinducer inactivation protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               EKSGPVILTIDASYTKENFENEVPRGEDSELALSSIKRLKEVVMKEKPIVFFGHDIEQE

The invention describes an isolated polynucleotide encoding an autoinducer (N-acyl-homoserine lactone) inactivation protein. The autoinducer (N-acyl-homoserine lactone) inactivation protein. The call autoinducer is useful for increasing disease resistance in a plant or animal by introducing a polynucleotide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein canneal, in a manner that allows the cell to express the gene. The protein burnal, in a manner that allows the cell to express the gene. The protein contains and for reducing bacterial damage to a plant or animal pacterial cell transformed with the polynucleotide, especially a plant or bacterial cell transformed with the polynucleotide, especially a plant or animal bacterium preferably Bacillus thuringiensis which is from B1, B2, animal bacterium preferably Bacillus thuringiensis which is from B1, B2, disease in a susceptible plant or animal, where virulence is regulated by autoinducers e.g. potato soft rot disease caused by Erwinia carotovora.

This is the amino acid sequence of the autoinducer inactivation protein contains the amino acid sequence of the autoinducer inactivation protein activity of which is studied in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 EGLFNGTFVEGQVLPKMTEEDRIVNILKRVGYEPEDLLYIISSHLHFDHAGGNGAFINTP 120

The invention describes an isolated polynuclectide encoding an autoinducer (N-acyl-homoserine lactone) inactivation protein. The polynuclectide is useful for increasing disease remistance in a plant or animal by introducing a polynuclectide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein is useful for reducing bacterial damage to a plant or animal preferably human; and for reducing the formation of bacterial biofilms, by exposing biofilm-forming bacteria to the autoinducer inactivation protein. A bacterial cell transformed with the polynuclectide, especially a plant or animal bacterium preferably Bacillus thuringiensis which is from B1, B2, animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ţ

B17, B18, B20, B21, B22 and B25, is useful for increasing recommended by disease in a susceptible plant or animal, where virulence is regulated by autoinducers e.g. potato soft rot disease caused by Erwinia carotovora. This is the amino acid sequence of the autoinducer inactivation protein AilJ, the autoinducer inactivation activity of which is studied in the
                                                                                                                                                                                                                                   120
                                                                                                                                                                                                                                                                                        180

Polynucleotide encoding autoinducer inactivation protein, bacterium having polynucleotide, and protein useful for increasing resistance a disease in sustainable plant or animal and for reducing bacterial

The invention describes an isolated polynucleotide encoding an autoinducer (N-acyl-homoserine lactone) inactivation protein. The patching autoinducer (N-acyl-homoserine lactone) inactivation protein. The polynucleotide is useful for increasing disease resistance in a plant or animal by introducing a polynucleotide into a cell of such a plant or animal by introducing a polynucleotide into a cell of such a plant or is useful for reducing bacterial damage to a plant or animal preferably human; and for reducing the formation of bacterial biofilms, by exposing biofilm-forming bacteria to the autoinducer inactivation protein. A caterial cell transformed with the polynucleotide, especially a plant or animal bacterium preferably Bacillus thuringiensis which is from B1, B2, B17, B18, B20, B21, B22 and B25, is useful for increasing resistance to a disease in a susceptible plant or animal, where virulence is regulated by autoinducers e.g. potato soft rot disease caused by Erwinia carotovora.

This is the amino acid sequence of the autoinducer inactivation protein activity of which is studied in the Claim 17; Fig 9; 82pp; English. invention

The invention describes an isolated polynuclectide encoding an autoinducer (N-acyl-homoserine lactone) inactivation protein. The autoinducer (N-acyl-homoserine lactone) inactivation protein. The colynuclectide is useful for increasing disease resistance in a plant or animal by introducing a polynuclectide into a cell of such a plant or animal by introducing a polynuclectide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein set useful for reducing bacterial damage to a plant or animal preferably human; and for reducing the formation of bacterial biofilms, by exposing biofilm-forming bacteria to the autoinducer inactivation protein. A canimal bacterium preferably Bacillus thuringiensis which is from B1, B2, B17, B18, B20, B21, B22 and B25, is useful for increasing resistance to a disease in a susceptible plant or animal, where virulence is regulated by autoinducers e.g. potato soft rot disease caused by Erwinia carotovora.

The invention describes an isolated polymucleotide encoding an autoinducer (N-acyl-homoserine lactone) inactivation protein. The public is useful for increasing disease resistance in a plant or animal by introducing a polymucleotide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein canimal, in a manner that allows the cell to express the gene. The protein content is useful for reducing bacterial damage to a plant or animal preferably thuman; and for reducing the formation of bacterial biofilms, by exposing biofilm-forming bacteria to the autoinducer inactivation protein. A canimal bacterium preferably Bacillus thuringiensis which is from B1, B2, B17, B18, B20, B21, B2 and B25, is useful for increasing resistance to a disease in a susceptible plant or animal, where virulence is regulated by autoinducers e.g. potato soft rot disease caused by Erwinia carotovora. This is the amino acid sequence of the autoinducer inactivation protein animal is the autoinducer inactivation activity of which is studied in the invention.

The present invention relates to the genome sequence of Listeria

CC monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of
monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of
the are useful for selecting probes and primers for detecting genes in L.

CM monocytogenes and related organisms, and for studying genetic
monocytogenes and ther genome. The present invention. Proteins
capressed from the genome sequence of the present invention. Proteins
capressed from the genome sequence are useful for raising specific
antibodies, identification of L. monocytogenes and related organisms, and
controlled to the present invention of the minimit of the genome sequence and proteins encoded by it are also useful for
selecting compounds that regulate gene expression and cell replication
and modulate L. monocytogenes-related diseases. In addition, the genome
sequence and proteins encoded by it are also useful for
and modulate L. monocytogenes-related diseases. In addition, the genome
sequence and proteins encoded by it are useful in pharmaceutical and
controlled to the treatment or prevention of infections by L.

CM monocytogenes and related organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                146

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ð
                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF86431 and AAH41223-7) and P. abyssi proteins. P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea thydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centigated.
Note: This patent is in the same patent family as WO200065062, which AAH75903-AAH75920 and AAG66436.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   82 RIVNILKRVGYEPEDLLYIISSHLHFDHAGGNGAFINTPIIVQRAEY----EAAQHSEEY 137

The invention relates to proteins (AAB73538-AAB73541) from Burkholderia cepacia which enhance the production of lipase, and the genes (AAH20219-AAH20222) encoding the lipase production-enhancing proteins. The genes of the invention were isolated from a 6.0 kb fragment of Burkholderia cepacia genomic DNA (AAH20223) which also concains the lipase (AAB73542). The invention also relates to expression cassettes, vectors, and transformants containing a gene of the invention and a lipase. The novel proteins and genes may be used in active compounds such as intermediates for drugs and agricultural chemicals. The production of lipase, which is for the preparation of optically chemicals. The present sequence represents a Burkholderia cepacia SC-20 lipase production-enhancing protein, designated OrfC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      95 EDLLYIISSHLHFDHAGG--NG---AFINTPIIVQRAEYEAAQHSEEYLKECILPNLNY 148
